

# PJ 2<sup>nd</sup> Generation Open Frame Power Supply

## PJ-□□V150W□RA

# PJ 2<sup>nd</sup> Gen.

### Highlights & Features

- 200% Power Boost
- Comply with JAPAN DEN-AN New
- Built-in Remote ON/OFF New
- Low profile design
- Low Inrush Current / Low Leakage Current
- High efficiency and power factor to conserve energy
- Conforms to harmonic current IEC/EN/BS EN 61000-3-2, Class A
- Conformal coating on PCBA to protect against chemical and dust pollutants
- Versatile configuration options: Open Frame & Enclosed

### Safety Standards

CB Certified for worldwide use

**Model Number:** PJ-□□V150W□RA

**Open Frame:** 0.25 kg (0.55 lb)

**Enclosed:** 0.46 kg (1.01 lb)

**Dimensions (L x W x H):** Open Frame:

160 x 75 x 27 mm  
(6.30 x 2.95 x 1.06 inch)

**Enclosed:**

188 x 85 x 47 mm  
(7.40 x 3.35 x 1.85 inch)

### General Description

New 2nd generation PJ series of Open Frame Power Supply design with low profile (27mm) and built-in Power Boost of 200% for 10 seconds enables reserve power to be always available for reliable startup of loads with high inrush current, thus eliminating the need of a more expensive power supply unit at higher power rating. Other features include low leakage / Inrush current / remote on/off control and conformal coating on the PCBAs to provide protection against dust and chemical pollutants. Metal chassis and case cover are available as options for different installation preferences. New PJ series conforms to major international safety standards according to EN/UL 62368-1 standards and are fully compliant with compliance with Japan PSE (DEN-AN).

### Model Information

#### PJ Open Frame Power Supply

| Model Number  | Input Voltage Range     | Rated Output Voltage | Rated Output Current |
|---------------|-------------------------|----------------------|----------------------|
| PJ-□□V150W□RA | 85-264 Vac (120-373Vdc) | 12 Vdc               | 12.5 A               |
|               |                         | 24 Vdc               | 6.30 A               |
|               |                         | 48 Vdc               | 3.2 A                |

### Assembly & Installation

#### Assembly Reference

##### ■ Open Frame

##### ■ L Frame / Enclosed

For safety reasons, please ensure the mounted device is kept safety distance as below at all sides from other components and equipments.

a) For Open Frame Type  $\geq 8$  mm (0.315 inch) from primary side and  $\geq 4$  mm (0.16 inch) from secondary side.

b) For with Case Type  $\geq 4$  mm (0.16 inch)

**Please insert an insulation sheet between the system and product, if the safety distance is less than 4 mm (0.16 inch).**

- Use flexible cable (stranded or solid) of AWG No. 22-18. Please refer to Table 1 for the recommended Housing and Terminal.
- For the Remote ON/OFF function, use flexible cable (stranded or solid) of AWG No. 28-22.

Table 1

|  | Connector (Board Mounting) | Housing | Terminal      |
|--|----------------------------|---------|---------------|

### Mounting Orientation

- Any excessive twisting or bending may damage the device's PCB. Please handle the device with care.
- The device is not recommended to be placed on low thermal conductive surfaces. For example, plastics.
- Prevent any foreign metal, particles or conductors from entering the device through the openings during installation. It may cause: -Electric shock; Safety hazard; Product failure.
- The power supply must be mounted by metal screws onto a grounded metal surface. It is highly recommended that the Earth terminal on the connector be connected to the grounded metal surface.**

### Forced Cooling (Air Velocity > 0.7m/s)

#### Output Load De-rating VS Surrounding Air Temperature

■ Air Flow Direction

Fig. 1.3 De-rating for Mounting Orientation A to F  
> 50°C de-rate power by 2% / °C

### Notes

1. Power supply components may degrade, or be damaged, when the power supply is continuously used outside the shaded region, refer to the graphs shown above.
2. If the output capacity is not reduced when the surrounding air temperature is more than the upper limit temperature, the device will run into Over Temperature Protection. When activated, the output voltage will go into bouncing mode and will recover when the surrounding air temperature is lowered or the load is reduced as far as necessary to keep the device in working condition.
3. Depending on the surrounding air temperature and output load delivered by the power supply, the device housing can be very hot!
4. If the device has to be mounted in any other orientation, please leave a message via the [Contact Us](#) form.

< 90 Vac de-rate power by 2% / V

### Functional Manual

#### Remote ON/OFF Function

You can remotely control the power supply unit to turn ON/OFF by using an external DC source. Follow the DC power source voltage and current limiting defined in the table below.

| Built-in Resistor $R_i$ (ohm) | Voltage Between RC+ and RC- (V) |            | Input Current (mA) |
|-------------------------------|---------------------------------|------------|--------------------|
|                               | Output ON                       | Output OFF |                    |
| 1.5k                          | 0-0.5 V                         | 5-12.5 V   | 20mA Max           |

#### Notes

- Remote ON/OFF circuits are isolated from input, output and PE.
- Please check if the polarity of the wire connector is the same as the external DC source. If not, the power would not turn on and the internal components may be damaged.
- You do not need an external resistance  $R_o$  for current limit while the output voltage of external DC source is within the range of 5-12.5 V. If the output voltage exceeds 12.5 V, please use the following equation for the value of current limit resistance  $R_o$ .

$$R_o = \frac{Vcc - (3.5 + 0.006R_i)}{0.006}$$

### Functions

#### Start-up Time

The time required for the output voltage to reach 90% of its final steady state set value, after the input voltage is applied.

#### Rise Time

The time required for the output voltage to change from 10% to 90% of its final steady state set value.

#### Hold-up Time

Time between the collapse of the AC input voltage, and the output falling to 95% of its steady state set value.

#### ■ Graph illustrating the Start-up Time, Rise Time, and Hold-up Time

## PJ-150W series 1 Phase / PJ-□□V150W□RA

### Dynamic Response

The power supply output voltage will remain within  $\pm 5\%$  of its steady state value, when subjected to a dynamic load from 0 to 50% and 50 to 100% of its rated current.

### Inrush Current

Inrush current is the peak, instantaneous, input current measured and, occurs when the input voltage is first applied. For AC input voltages, the maximum peak value of inrush current will occur during the first half cycle of the applied AC voltage. This peak value decreases exponentially during subsequent cycles of AC voltage.

### Overvoltage Protection

The power supply's overvoltage circuit will be activated when its internal feedback circuit fails. The output voltage shall not exceed its specifications defined on Page 3 under "Protections". The power supply should be latch.

### Short Circuit Protection (Auto-Recovery)

The power supply's output OLP/OCP function also provides protection against short circuits. When a short circuit is applied, the output current will operate in "Hiccup mode", as shown in the illustration in the OLP/OCP section on this page. The power supply will return to normal operation after the short circuit is removed.

### Overload & Overcurrent Protections (Auto-Recovery)

The power supply's Overload (OLP) and Overcurrent (OCP) Protections will be activated when output current exceeds 105% of  $I_o$  (Max load). In such occurrence, the  $V_o$  will start to droop and once the power supply has reached its maximum power limit, the protection is activated and the power supply will go into "Hiccup mode" (Auto-Recovery). The power supply will recover once the fault condition of the OLP and OCP is removed and  $I_o$  is back within the specifications.

It is not recommended to prolong the duration of  $I_o$  when it is 201% but  $>100\%$ , since it may cause damage to the PSU.

### Over Temperature Protection

As mentioned above, the power supply also has Over Temperature Protection (OTP). This is activated when the overload condition persists for an extended duration and the output current is below the overload trigger point but  $>100\%$  load. In the event of a higher operating condition at 100% load, the power supply will run into OTP when the surrounding air temperature is higher than the operating temperature. When activated, the output voltage will go into latch mode until the mains is reapplied and the surrounding air temperature drops to its normal operating temperature.

## PJ-150W series 1 Phase / PJ-□□V150W□RA

### Power Boost

Power Boost is the reserve power available constantly that allows reliable startup to support sudden and short spike of loads with high inrush current typically during turn on to remove the need of more expensive higher rated power supply unit. After the output has reached its steady state set value, the power supply can support surge loads with a higher short-term power demand up to 200% of maximum rated load ( $I_{o\ Max}$ ), for a maximum duration of 10 seconds. The Power Boost is also available to repeatedly basis with according to the condition of an average (R.M.S) output power shall not exceed continuous operating condition or refer to duty cycle calculation below.

Fig. 2 Duty Cycle Calculation

$$I_{rms} \leq \text{Rated current}$$

$$\text{Duty} = \frac{t_p}{t_p + t_N} \times 100[\%] \leq 40\%$$

$$I_{rms}^2 = \frac{I_{Power\ Boost}^2 \times t_p + I_{Non\ Power\ Boost}^2 \times t_N}{t_p + t_N}$$

$$I_{Non\ Power\ Boost} = \sqrt{\frac{I_{rms}^2 \times (t_p + t_N) - I_{Power\ Boost}^2 \times t_p}{t_N}}$$

- An example of Power Boost and Average Output Power

| Power Boost | Peak Power (WP) | Power Boost Duration (TP) | Duty Cycle | Non-Peak Power (WN) | Non-Peak Power Duration (TN) | Total Time (T) |
|-------------|-----------------|---------------------------|------------|---------------------|------------------------------|----------------|
| 200%        | 302.4 W         | 10 sec                    | 15%        | 103.7 W             | 57 sec                       | 67 sec         |
| 200%        | 302.4 W         | 5 sec                     | 15%        | 103.7 W             | 28 sec                       | 33 sec         |
| 150%        | 226.8 W         | 10 sec                    | 40%        | 61.7 W              | 15 sec                       | 25 sec         |
| 150%        | 226.8 W         | 5 sec                     | 40%        | 61.7 W              | 7.5 sec                      | 12.5 sec       |

It is not recommended to prolong the duration of Power Boost to be longer than the specified duty cycle calculation, this may cause damage to the PSU.

### Others

#### Conformal Coating

#### The Protective Coating Technology

Delta Electronics Group has designed the perfect dipping technique which penetrates everywhere including under device, and prevents leakage. The conformal coating dipping can be applied to PCBs or circuit board. The coating preserves the performance of precision electronic primarily by preventing ionizable contaminants such as salt from reaching circuit nodes, where the material slumps around sharp edges. This can be a problem especially in highly conversing atmosphere.

### Attention
